## **Principle of Mathematical Induction Class 11**

Chapter 4 Principle of Mathematical Induction Exercise 4.1 Solutions

Exercise 4.1: Solutions of Questions on Page Number: 94

Q1:

Prove the following by using the principle of mathematical induction for all  $n \in N$ :

$$1+3+3^2+...+3^{n-1}=\frac{\left(3^n-1\right)}{2}$$

#### Answer:

Let the given statement be P(n), i.e.,

P(n): 1 + 3 + 3<sup>2</sup> + ...+ 3<sup>nec-1</sup> = 
$$\frac{\left(3^{n} - 1\right)}{2}$$

For n = 1, we have

P(1): 1 = 
$$\frac{(3^1 - 1)}{2} = \frac{3 - 1}{2} = \frac{2}{2} = 1$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1+3+3^2+...+3^{k-1} = \frac{\left(3^k-1\right)}{2}$$
 ...(i)

We shall now prove that P(k + 1) is true.

$$= (1 + 3 + 3^2 + ... + 3^{kae^{-1}}) + 3^k$$

$$= \frac{\left(3^{k} - 1\right)}{2} + 3^{k}$$
 [Using (i)]
$$= \frac{\left(3^{k} - 1\right) + 2 \cdot 3^{k}}{2}$$

$$= \frac{\left(1 + 2\right)3^{k} - 1}{2}$$

$$= \frac{3 \cdot 3^{k} - 1}{2}$$

$$= \frac{3^{k+1} - 1}{2}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q2:

Prove the following by using the principle of mathematical induction for

$$1^3 + 2^3 + 3^3 + \dots + n^3 = \left(\frac{n(n+1)}{2}\right)^2$$

all  $n \in N$ :

#### Answer:

Let the given statement be P(n), i.e.,

$$1^{3} + 2^{3} + 3^{3} + \dots + n^{3} = \left(\frac{n(n+1)}{2}\right)^{2}$$

For n = 1, we have

$$P(1): 1^{\circ} = 1 = \left(\frac{1(1+1)}{2}\right)^{2} = \left(\frac{1.2}{2}\right)^{2} = 1^{2} = 1$$
 , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1^3 + 2^3 + 3^3 + \dots + k^3 = \left(\frac{k(k+1)}{2}\right)^2$$
 ... (i)

We shall now prove that P(k + 1) is true.

# $\frac{\text{www.eduinput.com}}{1^3 + 2^3 + 3^3 + \dots + k^3 + (k+1)^3}$

$$1^3 + 2^3 + 3^3 + \dots + k^3 + (k+1)^3$$

$$= \left(\frac{k(k+1)}{2}\right)^{2} + (k+1)^{3}$$

$$= \frac{k^{2}(k+1)^{2}}{4} + (k+1)^{3}$$

$$= \frac{k^{2}(k+1)^{2} + 4(k+1)^{3}}{4}$$

$$= \frac{(k+1)^{2}\{k^{2} + 4(k+1)\}}{4}$$

$$= \frac{(k+1)^{2}\{k^{2} + 4k + 4\}}{4}$$

$$= \frac{(k+1)^{2}(k+2)^{2}}{4}$$

$$= \frac{(k+1)^{2}(k+1+1)^{2}}{4}$$

$$= \frac{(k+1)^{2}(k+1+1)^{2}}{4}$$

$$= \frac{(k+1)^{2}(k+1+1)^{2}}{4}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q3:

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $1 + \frac{1}{(1+2)} + \frac{1}{(1+2+3)} + \dots + \frac{1}{(1+2+3+\dots n)} = \frac{2n}{(n+1)}$ 

#### Answer:

Let the given statement be P(n), i.e.,

P(n): 
$$1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots n} = \frac{2n}{n+1}$$

For n = 1, we have

$$P(1): 1 = \frac{2.1}{1+1} = \frac{2}{2} = 1$$
 which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1 + \frac{1}{1+2} + \dots + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots+k} = \frac{2k}{k+1} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots+k} + \frac{1}{1+2+3+\dots+k+(k+1)}$$

$$= \left(1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots+k}\right) + \frac{1}{1+2+3+\dots+k+(k+1)}$$

$$= \frac{2k}{k+1} + \frac{1}{1+2+3+\dots+k+(k+1)} \qquad [Using (i)]$$

$$= \frac{2k}{k+1} + \frac{1}{\left(\frac{(k+1)(k+1+1)}{2}\right)} \qquad \left[1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}\right]$$

$$= \frac{2k}{(k+1)} + \frac{2}{(k+1)(k+2)}$$

$$= \frac{2}{(k+1)} \left(\frac{k(k+2)+1}{k+2}\right)$$

$$= \frac{2}{(k+1)} \left(\frac{k^2 + 2k + 1}{k+2}\right)$$

$$= \frac{2 \cdot (k+1)^2}{(k+1)(k+2)}$$

$$= \frac{2(k+1)}{(k+2)}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

Q4:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ : 1.2.3 + 2.3.4 + ... + n(n + 1)

$$(n+2) = \frac{n(n+1)(n+2)(n+3)}{4}$$

#### Answer:

Let the given statement be P(n), i.e.,

$$\frac{n(n+1)(n+2)(n+3)}{4}$$

$$P(n)$$
: 1.2.3 + 2.3.4 + ... +  $n(n + 1) (n + 2) =$ 

For n = 1, we have

P(1): 1.2.3 = 6 = 
$$\frac{1(1+1)(1+2)(1+3)}{4} = \frac{1.2.3.4}{4} = 6$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.2.3 + 2.3.4 + ... + k(k+1)(k+2) = \frac{k(k+1)(k+2)(k+3)}{4} ... (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$1.2.3 + 2.3.4 + \dots + k(k+1)(k+2) + (k+1)(k+2)(k+3)$$
$$= \{1.2.3 + 2.3.4 + \dots + k(k+1)(k+2)\} + (k+1)(k+2)(k+3)$$

$$= \frac{k(k+1)(k+2)(k+3)}{4} + (k+1)(k+2)(k+3) \qquad \text{[Using (i)]}$$

$$= (k+1)(k+2)(k+3)\left(\frac{k}{4}+1\right)$$

$$= \frac{(k+1)(k+2)(k+3)(k+4)}{4}$$

$$= \frac{(k+1)(k+1+1)(k+1+2)(k+1+3)}{4}$$

Thus, P(k + 1) is true whenever P(k)

is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q5:

Prove the following by using the principle of mathematical induction for

$$1.3 + 2.3^{2} + 3.3^{3} + ... + n.3^{n} = \frac{(2n-1)3^{n+1} + 3}{4}$$
all  $n \in \mathbb{N}$ :

Answer:

Let the given statement be P(n), i.e.,

$$1.3 + 2.3^{2} + 3.3^{3} + ... + n3^{n} = \frac{(2n-1)3^{n+1} + 3}{4}$$

P(*n*):

For n = 1, we have

P(1): 1.3 = 3 = 
$$\frac{(2.1-1)3^{1+1}+3}{4} = \frac{3^2+3}{4} = \frac{12}{4} = 3$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.3 + 2.3^{2} + 3.3^{3} + \dots + k3^{k} = \frac{(2k-1)3^{k+1} + 3}{4} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$1.3 + 2.3^{2} + 3.3^{3} + ... + k3^{k} + (k+1) 3^{k+1}$$
$$= (1.3 + 2.3^{2} + 3.3^{3} + ... + k.3^{k}) + (k+1) 3^{k+1}$$

$$= \frac{(2k-1)3^{k+1} + 3}{4} + (k+1)3^{k+1}$$

$$= \frac{(2k-1)3^{k+1} + 3 + 4(k+1)3^{k+1}}{4}$$

$$= \frac{3^{k+1} \left\{ 2k - 1 + 4(k+1) \right\} + 3}{4}$$

$$= \frac{3^{k+1} \left\{ 6k + 3 \right\} + 3}{4}$$

$$= \frac{3^{k+1} \cdot 3 \left\{ 2k + 1 \right\} + 3}{4}$$

$$= \frac{3^{(k+1)+1} \left\{ 2k + 1 \right\} + 3}{4}$$

$$= \frac{\left\{ 2(k+1) - 1 \right\} 3^{(k+1)+1} + 3}{4}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

Q6:

Prove the following by using the principle of mathematical induction for

$$1.2 + 2.3 + 3.4 + \dots + n.(n+1) = \left\lfloor \frac{n(n+1)(n+2)}{3} \right\rfloor$$

all  $n \in N$ :

#### Answer:

Let the given statement be P(n), i.e.,

$$1.2 + 2.3 + 3.4 + ... + n.(n+1) = \left[\frac{n(n+1)(n+2)}{3}\right]$$

P(*n*):

For n = 1, we have

P(1): 
$$1.2 = 2 = \frac{1(1+1)(1+2)}{3} = \frac{1.2.3}{3} = 2$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

1.2 + 2.3 + 3.4 + ... + k.(k + 1) + (k + 1).(k + 2)

$$1.2 + 2.3 + 3.4 + \dots + k.(k+1) = \left\lceil \frac{k(k+1)(k+2)}{3} \right\rceil \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$= [1.2 + 2.3 + 3.4 + ... + k.(k+1)] + (k+1).(k+2)$$

$$= \frac{k(k+1)(k+2)}{3} + (k+1)(k+2)$$

$$= (k+1)(k+2)(\frac{k}{3}+1)$$

$$= \frac{(k+1)(k+2)(k+3)}{3}$$

$$= \frac{(k+1)(k+1+1)(k+1+2)}{3}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q7:

Prove the following by using the principle of mathematical induction for

all 
$$n \in \mathbb{N}$$
: 
$$1.3 + 3.5 + 5.7 + ... + (2n-1)(2n+1) = \frac{n(4n^2 + 6n - 1)}{3}$$

#### Answer:

Let the given statement be P(n), i.e.,

$$1.3+3.5+5.7+...+(2n-1)(2n+1)=\frac{n(4n^2+6n-1)}{3}$$

P(*n*):

For n = 1, we have

$$P(1):1.3=3=\frac{1(4.1^2+6.1-1)}{3}=\frac{4+6-1}{3}=\frac{9}{3}=3$$
 , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.3 + 3.5 + 5.7 + \dots + (2k-1)(2k+1) = \frac{k(4k^2 + 6k - 1)}{3} \dots (i)$$

We shall now prove that P(k + 1) is true.

$$(1.3 + 3.5 + 5.7 + ... + (2k \hat{a} \in ^{\omega} 1) (2k + 1) + \{2(k + 1) \hat{a} \in ^{\omega} 1\} \{2(k + 1) + 1\}$$

$$= \frac{k(4k^2 + 6k - 1)}{3} + (2k + 2 - 1)(2k + 2 + 1) \qquad \text{[Using (i)]}$$

$$= \frac{k(4k^2 + 6k - 1)}{3} + (2k + 1)(2k + 3)$$

$$= \frac{k(4k^2 + 6k - 1)}{3} + (4k^2 + 8k + 3)$$

$$= \frac{k(4k^2 + 6k - 1) + 3(4k^2 + 8k + 3)}{3}$$

$$= \frac{4k^3 + 6k^2 - k + 12k^2 + 24k + 9}{3}$$

$$= \frac{4k^3 + 18k^2 + 23k + 9}{3}$$

$$= \frac{4k^3 + 14k^2 + 9k + 4k^2 + 14k + 9}{3}$$

$$= \frac{k(4k^2 + 14k + 9) + 1(4k^2 + 14k + 9)}{3}$$

$$= \frac{(k+1)(4k^2 + 14k + 9)}{3}$$

$$= \frac{(k+1)\{4k^2 + 8k + 4 + 6k + 6 - 1\}}{3}$$

$$= \frac{(k+1)\{4(k^2 + 2k + 1) + 6(k + 1) - 1\}}{3}$$

$$= \frac{(k+1)\{4(k+1)^2 + 6(k+1) - 1\}}{3}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q8:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :  $1.2 + 2.2^2 + 3.2^2 + ... + n.2^n = (n-1) 2^{n+1} + 2$ 

#### Answer:

Let the given statement be P(n), i.e.,

P(n): 1.2 + 2.2<sup>2</sup> + 3.2<sup>2</sup> + ... + n.2<sup>n</sup> = (n â
$$\in$$
 1) 2<sup>n+1</sup> + 2

For n = 1, we have

P(1): 1.2 = 2 = (1 
$$\hat{a} \in 1$$
 1)  $2^{1+1} + 2 = 0 + 2 = 2$ , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.2 + 2.2^2 + 3.2^2 + ... + k.2^k = (k \hat{a} \in 1) 2^{k+1} + 2 ... (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$\begin{aligned}
&\left\{1.2 + 2.2^2 + 3.2^3 + \dots + k.2^k\right\} + \left(k+1\right) \cdot 2^{k+1} \\
&= \left(k-1\right) 2^{k+1} + 2 + \left(k+1\right) 2^{k+1} \\
&= 2^{k+1} \left\{ \left(k-1\right) + \left(k+1\right) \right\} + 2 \\
&= 2^{k+1} \cdot 2k + 2 \\
&= k \cdot 2^{(k+1)+1} + 2 \\
&= \left\{ \left(k+1\right) - 1 \right\} 2^{(k+1)+1} + 2
\end{aligned}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

Q9:

Prove the following by using the principle of mathematical induction for

all 
$$n \in \mathbb{N}$$
:  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} = 1 - \frac{1}{2^n}$ 

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n)$$
:  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} = 1 - \frac{1}{2^n}$ 

For n = 1, we have

$$P(1)$$
:  $\frac{1}{2} = 1 - \frac{1}{2^1} = \frac{1}{2}$ , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^k} = 1 - \frac{1}{2^k}$$
 ... (i)

We shall now prove that P(k + 1) is true.

Consider

$$\left(\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^k}\right) + \frac{1}{2^{k+1}}$$

$$= \left(1 - \frac{1}{2^k}\right) + \frac{1}{2^{k+1}}$$

$$= 1 - \frac{1}{2^k} + \frac{1}{2 \cdot 2^k}$$

$$= 1 - \frac{1}{2^k} \left(1 - \frac{1}{2}\right)$$

$$= 1 - \frac{1}{2^k} \left(\frac{1}{2}\right)$$

$$= 1 - \frac{1}{2^{k+1}}$$
[Using (i)]

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

Q10:

Prove the following by using the principle of mathematical induction for

$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3n-1)(3n+2)} = \frac{n}{(6n+4)}$$

## Answer:

Let the given statement be P(n), i.e.,

$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3n-1)(3n+2)} = \frac{n}{(6n+4)}$$

For n = 1, we have

$$P(1) = \frac{1}{2.5} = \frac{1}{10} = \frac{1}{6.1 + 4} = \frac{1}{10}$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3k-1)(3k+2)} = \frac{k}{6k+4}$$
 ... (i)

We shall now prove that P(k + 1) is true.

$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3k-1)(3k+2)} + \frac{1}{\{3(k+1)-1\}\{3(k+1)+2\}}$$

$$= \frac{k}{6k+4} + \frac{1}{(3k+2)(3k+3+2)} \qquad [Using (i)]$$

$$= \frac{k}{6k+4} + \frac{1}{(3k+2)(3k+5)}$$

$$= \frac{k}{2(3k+2)} + \frac{1}{(3k+2)(3k+5)}$$

$$= \frac{1}{(3k+2)} \left( \frac{k}{2} + \frac{1}{3k+5} \right)$$

$$= \frac{1}{(3k+2)} \left( \frac{k(3k+5)+2}{2(3k+5)} \right)$$

$$= \frac{1}{(3k+2)} \left( \frac{3k^2+5k+2}{2(3k+5)} \right)$$

$$= \frac{1}{(3k+2)} \left( \frac{(3k+2)(k+1)}{2(3k+5)} \right)$$

$$= \frac{(k+1)}{6k+10}$$

$$= \frac{(k+1)}{6(k+1)+4}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q11:

Prove the following by using the principle of mathematical induction for

$$all \ n \in \mathbb{N}: \frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{n(n+3)}{4(n+1)(n+2)}$$

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n): \frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{n(n+3)}{4(n+1)(n+2)}$$

For n = 1, we have

$$P(1): \frac{1}{1 \cdot 2 \cdot 3} = \frac{1 \cdot (1+3)}{4(1+1)(1+2)} = \frac{1 \cdot 4}{4 \cdot 2 \cdot 3} = \frac{1}{1 \cdot 2 \cdot 3}, \text{ which is true.}$$

Let P(k) be true for some positive integer k, i.e.,

$$\frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \frac{1}{3 \cdot 4 \cdot 5} + \dots + \frac{1}{k(k+1)(k+2)} = \frac{k(k+3)}{4(k+1)(k+2)}$$
 ... (i)

We shall now prove that P(k + 1) is true.

$$\left[ \frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \frac{1}{3 \cdot 4 \cdot 5} + \dots + \frac{1}{k(k+1)(k+2)} \right] + \frac{1}{(k+1)(k+2)(k+3)}$$

$$= \frac{k(k+3)}{4(k+1)(k+2)} + \frac{1}{(k+1)(k+2)(k+3)} \qquad [Using (i)]$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k+3)}{4} + \frac{1}{k+3} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k+3)^2 + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k^3 + 6k^2 + 9k + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k^3 + 2k^2 + k + 4k^2 + 8k + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k^2 + 2k + 1) + 4(k^2 + 2k + 1)}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k+1)^2 + 4(k+1)^2}{4(k+3)} \right\}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)(k+2)(k+3)}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)(k+2)(k+3)}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)(k+2)(k+3)}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)(k+2)(k+3)}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q12:

Prove the following by using the principle of mathematical induction for

$$a + ar + ar^2 + ... + ar^{n-1} = \frac{a(r^n - 1)}{r - 1}$$
 all  $n \in \mathbb{N}$ :

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n): a + ar + ar^2 + ... + ar^{n-1} = \frac{a(r^n - 1)}{r - 1}$$

For n = 1, we have

$$\mathbf{P} \left( 1 \right) : a = \frac{a \left( r^1 - 1 \right)}{\left( r - 1 \right)} = a$$
 , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$a + ar + ar^{2} + \dots + ar^{k-1} = \frac{a(r^{k} - 1)}{r - 1}$$
 ... (i)

We shall now prove that P(k + 1) is true.

Consider

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q13:

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\left(1 + \frac{3}{1}\right)\left(1 + \frac{5}{4}\right)\left(1 + \frac{7}{9}\right)...\left(1 + \frac{(2n+1)}{n^2}\right) = (n+1)^2$ 

Answer:		

Let the given statement be P(n), i.e.,

$$P(n): \left(1 + \frac{3}{1}\right) \left(1 + \frac{5}{4}\right) \left(1 + \frac{7}{9}\right) \dots \left(1 + \frac{(2n+1)}{n^2}\right) = (n+1)^2$$

For n = 1, we have

$$P(1): (1+\frac{3}{1}) = 4 = (1+1)^2 = 2^2 = 4$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$\left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)...\left(1+\frac{(2k+1)}{k^2}\right)=(k+1)^2 \qquad ... (1)$$

We shall now prove that P(k + 1) is true.

Consider

$$\left[ \left( 1 + \frac{3}{1} \right) \left( 1 + \frac{5}{4} \right) \left( 1 + \frac{7}{9} \right) \dots \left( 1 + \frac{(2k+1)}{k^2} \right) \right] \left\{ 1 + \frac{\{2(k+1)+1\}}{(k+1)^2} \right\} \\
= (k+1)^2 \left( 1 + \frac{2(k+1)+1}{(k+1)^2} \right) \qquad \left[ \text{Using}(1) \right] \\
= (k+1)^2 \left[ \frac{(k+1)^2 + 2(k+1)+1}{(k+1)^2} \right] \\
= (k+1)^2 + 2(k+1)+1 \\
= \left\{ (k+1)+1 \right\}^2$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q14:

Prove the following by using the principle of mathematical induction for

all 
$$n \in \mathbb{N}$$
:  $\left(1 + \frac{1}{1}\right) \left(1 + \frac{1}{2}\right) \left(1 + \frac{1}{3}\right) ... \left(1 + \frac{1}{n}\right) = (n+1)$ 

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n): \left(1+\frac{1}{1}\right)\left(1+\frac{1}{2}\right)\left(1+\frac{1}{3}\right)...\left(1+\frac{1}{n}\right) = (n+1)$$

For n = 1, we have

$$P(1): (1+\frac{1}{1})=2=(1+1)$$
, which is true

Let P(k) be true for some positive integer k, i.e.,

$$P(k): \left(1 + \frac{1}{1}\right) \left(1 + \frac{1}{2}\right) \left(1 + \frac{1}{3}\right) \dots \left(1 + \frac{1}{k}\right) = (k+1)$$
 ... (1)

We shall now prove that P(k + 1) is true.

Consider

$$\left[ \left( 1 + \frac{1}{1} \right) \left( 1 + \frac{1}{2} \right) \left( 1 + \frac{1}{3} \right) \dots \left( 1 + \frac{1}{k} \right) \right] \left( 1 + \frac{1}{k+1} \right) \\
= (k+1) \left( 1 + \frac{1}{k+1} \right) \qquad \left[ \text{Using (1)} \right] \\
= (k+1) \left( \frac{(k+1)+1}{(k+1)} \right) \\
= (k+1)+1$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q15:

Prove the following by using the principle of mathematical induction for

all 
$$n \in \mathbb{N}$$
: 
$$1^2 + 3^2 + 5^2 + \dots + (2n-1)^2 = \frac{n(2n-1)(2n+1)}{3}$$

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n) = 1^2 + 3^2 + 5^2 + \dots + (2n-1)^2 = \frac{n(2n-1)(2n+1)}{3}$$

For n = 1, we have

$$P(1) = 1^2 = 1 = \frac{1(2.1-1)(2.1+1)}{3} = \frac{1.1.3}{3} = 1$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$P(k) = 1^2 + 3^2 + 5^2 + \dots + (2k-1)^2 = \frac{k(2k-1)(2k+1)}{3}$$
 ... (1)

We shall now prove that P(k + 1) is true.

Consider

$$\begin{cases}
1^{2} + 3^{2} + 5^{2} + \dots + (2k-1)^{2} \\
= \frac{k(2k-1)(2k+1)}{3} + (2k+2-1)^{2} \\
= \frac{k(2k-1)(2k+1)}{3} + (2k+1)^{2} \\
= \frac{k(2k-1)(2k+1) + 3(2k+1)^{2}}{3} \\
= \frac{k(2k-1)(2k+1) + 3(2k+1)^{2}}{3} \\
= \frac{(2k+1)\{k(2k-1) + 3(2k+1)\}}{3} \\
= \frac{(2k+1)\{2k^{2} - k + 6k + 3\}}{3}$$

$$= \frac{(2k+1)\{2k^2+5k+3\}}{3}$$

$$= \frac{(2k+1)\{2k^2+2k+3k+3\}}{3}$$

$$= \frac{(2k+1)\{2k(k+1)+3(k+1)\}}{3}$$

$$= \frac{(2k+1)(k+1)(2k+3)}{3}$$

$$= \frac{(2k+1)\{2(k+1)-1\}\{2(k+1)+1\}}{3}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

### Q16:

Prove the following by using the principle of mathematical induction for

all 
$$n \in \mathbb{N}$$
:  $\frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3n-2)(3n+1)} = \frac{n}{(3n+1)}$ 

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n): \frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3n-2)(3n+1)} = \frac{n}{(3n+1)}$$

For n = 1, we have

$$P(1) = \frac{1}{1.4} = \frac{1}{3.1+1} = \frac{1}{4} = \frac{1}{1.4}$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$P(k) = \frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3k-2)(3k+1)} = \frac{k}{3k+1}$$
 ... (1)

We shall now prove that P(k + 1) is true.

Consider

$$\left\{ \frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3k-2)(3k+1)} \right\} + \frac{1}{\{3(k+1)-2\}\{3(k+1)+1\}}$$

$$= \frac{k}{3k+1} + \frac{1}{(3k+1)(3k+4)} \qquad \left[ \text{Using (1)} \right]$$

$$= \frac{1}{(3k+1)} \left\{ k + \frac{1}{(3k+4)} \right\}$$

$$= \frac{1}{(3k+1)} \left\{ \frac{k(3k+4)+1}{(3k+4)} \right\}$$

$$= \frac{1}{(3k+1)} \left\{ \frac{3k^2 + 4k + 1}{(3k+4)} \right\}$$

$$= \frac{1}{(3k+1)} \left\{ \frac{3k^2 + 3k + k + 1}{(3k+4)} \right\}$$

$$= \frac{(3k+1)(k+1)}{(3k+1)(3k+4)}$$

$$= \frac{(k+1)}{3(k+1)+1}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q17:

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2n+1)(2n+3)} = \frac{n}{3(2n+3)}$ 

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n): \frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2n+1)(2n+3)} = \frac{n}{3(2n+3)}$$

For n = 1, we have

$$P(1): \frac{1}{3.5} = \frac{1}{3(2.1+3)} = \frac{1}{3.5}$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$P(k): \frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2k+1)(2k+3)} = \frac{k}{3(2k+3)}$$
 ... (1)

We shall now prove that P(k + 1) is true.

$$\left[\frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2k+1)(2k+3)}\right] + \frac{1}{\{2(k+1)+1\}\{2(k+1)+3\}}$$

$$= \frac{k}{3(2k+3)} + \frac{1}{(2k+3)(2k+5)}$$

$$= \frac{1}{(2k+3)} \left[\frac{k}{3} + \frac{1}{(2k+5)}\right]$$

$$= \frac{1}{(2k+3)} \left[\frac{k(2k+5)+3}{3(2k+5)}\right]$$

$$= \frac{1}{(2k+3)} \left[\frac{2k^2+5k+3}{3(2k+5)}\right]$$

$$= \frac{1}{(2k+3)} \left[\frac{2k^2+2k+3k+3}{3(2k+5)}\right]$$

$$= \frac{1}{(2k+3)} \left[\frac{2k(k+1)+3(k+1)}{3(2k+5)}\right]$$

$$= \frac{(k+1)(2k+3)}{3(2k+3)(2k+5)}$$

$$= \frac{(k+1)}{3\{2(k+1)+3\}}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

## Q18 :

Prove the following by using the principle of mathematical induction for

all 
$$n \in \mathbb{N}$$
:  $1+2+3+...+n < \frac{1}{8}(2n+1)^2$ 

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n): 1+2+3+...+n < \frac{1}{8}(2n+1)^2$$

It can be noted that P(n) is true for n = 1 since  $1 < \frac{1}{8}(2.1+1)^2 = \frac{9}{8}$ 

Let P(k) be true for some positive integer k, i.e.,

$$1+2+...+k < \frac{1}{8}(2k+1)^2$$
 ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

Consider

$$(1+2+...+k)+(k+1)<\frac{1}{8}(2k+1)^{2}+(k+1)$$

$$<\frac{1}{8}\{(2k+1)^{2}+8(k+1)\}$$

$$<\frac{1}{8}\{4k^{2}+4k+1+8k+8\}$$

$$<\frac{1}{8}\{4k^{2}+12k+9\}$$

$$<\frac{1}{8}(2k+3)^{2}$$

$$<\frac{1}{8}\{2(k+1)+1\}^{2}$$

$$(1+2+3+...+k)+(k+1)<\frac{1}{8}(2k+1)^2+(k+1)$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q19:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ : n(n + 1)(n + 5) is a multiple of 3.

#### Answer:

Let the given statement be P(n), i.e.,

P(n): n(n + 1)(n + 5), which is a multiple of 3.

It can be noted that P(n) is true for n = 1 since 1(1 + 1)(1 + 5) = 12, which is a multiple of 3.

Let P(k) be true for some positive integer k, i.e., k(k+1)(k+5) is a multiple of 3.

:.
$$k(k + 1)(k + 5) = 3m$$
, where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$(k+1)\{(k+1)+1\}\{(k+1)+5\}$$

$$= (k+1)(k+2)\{(k+5)+1\}$$

$$= (k+1)(k+2)(k+5)+(k+1)(k+2)$$

$$= \{k(k+1)(k+5)+2(k+1)(k+5)\}+(k+1)(k+2)$$

$$= 3m+(k+1)\{2(k+5)+(k+2)\}$$

$$= 3m+(k+1)\{2k+10+k+2\}$$

$$= 3m+(k+1)(3k+12)$$

$$= 3m+3(k+1)(k+4)$$

$$= 3\{m+(k+1)(k+4)\} = 3\times q, \text{ where } q = \{m+(k+1)(k+4)\} \text{ is some natural number}$$
Therefore,  $(k+1)\{(k+1)+1\}\{(k+1)+5\}$  is a multiple of 3.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q20:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :  $10^{2n-1} + 1$  is divisible by 11.

#### Answer:

Let the given statement be P(n), i.e.,

P(n):  $10^{2n} e^{-1} + 1$  is divisible by 11.

It can be observed that P(n) is true for n = 1 since  $P(1) = 10^{2.1 \, \text{a} \cdot \text{c}^{-1}} + 1 = 11$ , which is divisible by 11. Let

P(k) be true for some positive integer k, i.e.,

10<sup>2kâ€" 1</sup> + 1 is divisible by 11.

∴10<sup>2k†1</sup> + 1 = 11m, where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$10^{2(k+1)-1} + 1$$

$$= 10^{2k+2-1} + 1$$

$$= 10^{2k+1} + 1$$

$$= 10^{2} (10^{2k-1} + 1 - 1) + 1$$

$$= 10^{2} (10^{2k-1} + 1) - 10^{2} + 1$$

$$= 10^{2} .11m - 100 + 1 \qquad [Using (1)]$$

$$= 100 \times 11m - 99$$

$$= 11(100m - 9)$$

$$= 11r, \text{ where } r = (100m - 9) \text{ is some natural number}$$
Therefore,  $10^{2(k+1)-1} + 1$  is divisible by 11.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q21:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :  $x^{2n} - y^{2n}$  is divisible by x + y.

#### Answer:

Let the given statement be P(n), i.e.,

P(n):  $x^{2n}$  â $\in$ "  $y^{2n}$  is divisible by x + y.

It can be observed that P(n) is true for n = 1.

This is so because  $X^2 \stackrel{\times 1}{=} \hat{a} \in \mathcal{Y}^2 \stackrel{\times 1}{=} X^2 \hat{a} \in \mathcal{Y}^2 = (x + y) \ (x \hat{a} \in \mathcal{Y})$  is divisible by (x + y).

Let P(k) be true for some positive integer k, i.e.,  $x^{2k}$  â $\in$  "  $y^{2k}$  is divisible by x + y.

∴
$$x^{2k}$$
 –  $y^{2k} = m(x + y)$ , where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$x^{2(k+1)} - y^{2(k+1)}$$

$$= x^{2k} \cdot x^2 - y^{2k} \cdot y^2$$

$$= x^2 \left( x^{2k} - y^{2k} + y^{2k} \right) - y^{2k} \cdot y^2$$

$$= x^2 \left\{ m(x+y) + y^{2k} \right\} - y^{2k} \cdot y^2 \qquad [Using (1)]$$

$$= m(x+y)x^2 + y^{2k} \cdot x^2 - y^{2k} \cdot y^2$$

$$= m(x+y)x^2 + y^{2k} \left( x^2 - y^2 \right)$$

$$= m(x+y)x^2 + y^{2k} \left( x + y \right) (x-y)$$

$$= (x+y) \left\{ mx^2 + y^{2k} \left( x - y \right) \right\}, \text{ which is a factor of } (x+y).$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q22:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :  $3^{2^n+2} - 8n - 9$  is divisible by 8.

#### Answer:

Let the given statement be P(n), i.e.,

P(n):  $3^{2n+2}$  â€" 8n â€" 9 is divisible by 8.

It can be observed that P(n) is true for n = 1 since  $3^{2 \times 1 + 2}$   $\hat{a} \in 8 \times 1$   $\hat{a} \in 9 = 64$ , which is divisible by 8. Let

P(k) be true for some positive integer k, i.e.,

3<sup>2k+ 2</sup> – 8k – 9 is divisible by 8.

∴3<sup>2k+2</sup> – 8k – 9 = 8m; where  $m_{\in}$  **N** ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$3^{2(k+1)+2} - 8(k+1) - 9$$

$$= 3^{2k+2} \cdot 3^2 - 8k - 8 - 9$$

$$= 3^2 (3^{2k+2} - 8k - 9 + 8k + 9) - 8k - 17$$

$$= 3^2 (3^{2k+2} - 8k - 9) + 3^2 (8k + 9) - 8k - 17$$

$$= 9.8m + 9(8k + 9) - 8k - 17$$

$$= 9.8m + 72k + 81 - 8k - 17$$

$$= 9.8m + 64k + 64$$

$$= 8(9m + 8k + 8)$$

$$= 8r, \text{ where } r = (9m + 8k + 8) \text{ is a natural number}$$
Therefore,  $3^{2(k+1)+2} - 8(k+1) - 9$  is divisible by 8.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q23:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :  $41^n - 14^n$  is a multiple of 27.

#### Answer:

Let the given statement be P(n), i.e.,

P(*n*):41<sup>*n*</sup> – 14<sup>*n*</sup>is a multiple of 27.

It can be observed that P(n) is true for n = 1 since  $41^1 - 14^1 = 27$ , which is a multiple of 27.

Let P(k) be true for some positive integer k, i.e.,

41<sup>k</sup> â€" 14<sup>k</sup>is a multiple of 27

∴41<sup>k</sup> â€" 14<sup>k</sup> = 27*m*, where 
$$m \in \mathbb{N}$$
 ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$41^{k+1} - 14^{k+1}$$

$$= 41^{k} \cdot 41 - 14^{k} \cdot 14$$

$$= 41(41^{k} - 14^{k} + 14^{k}) - 14^{k} \cdot 14$$

$$= 41(41^{k} - 14^{k}) + 41.14^{k} - 14^{k} \cdot 14$$

$$= 41.27m + 14^{k} (41 - 14)$$

$$= 41.27m + 27.14^{k}$$

$$= 27(41m - 14^{k})$$

$$= 27 \times r, \text{ where } r = (41m - 14^{k}) \text{ is a natural number}$$
Therefore,  $41^{k+1} - 14^{k+1}$  is a multiple of 27.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q24:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ : (2n

$$+7) < (n + 3)^2$$

#### Answer:

Let the given statement be P(n), i.e.,

$$P(n)$$
:  $(2n+7) < (n+3)^2$ 

It can be observed that P(n) is true for n = 1 since  $2.1 + 7 = 9 < (1 + 3)^2 = 16$ , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$(2k+7) < (k+3)^2 \dots (1)$$

We shall now prove that P(k + 1) is true whenever P(k) is true. Consider

$${2(k+1)+7} = (2k+7)+2$$

$$\therefore {2(k+1)+7} = (2k+7)+2 < (k+3)^2 +2$$

$$[u sing (1)]$$

$$2(k+1)+7 < k^2 +6k+9+2$$

$$2(k+1)+7 < k^2 +6k+11$$

$$Now, k^2 +6k+11 < k^2 +8k+16$$

$$\therefore 2(k+1)+7 < (k+4)^2$$

$$2(k+1)+7 < {(k+4)^2}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement $P(n)$ is true for all natural numbers i.e., $n$ .
