# **Real Numbers Class 10**

#### Unit 1 Real Numbers Exercise 1.1, 1.2, 1.3, 1.4 Solutions

Exercise 1.1 : Solutions of Questions on Page Number : 7

Q1 :

# Use Euclid's division algorithm to find the HCF of:

(i	) 135 and 225	(ii)	196 and 38220	(iii)	867 and 255
----	---------------	------	---------------	-------	-------------

## Answer :

(i) 135 and 225

Since 225 > 135, we apply the division lemma to 225 and 135 to obtain

225 = 135 x 1 + 90

Since remainder 90  $\neq$  0, we apply the division lemma to 135 and 90 to obtain

135 = 90 x 1 + 45

We consider the new divisor 90 and new remainder 45, and apply the division lemma to obtain

90 = 2 x 45 + 0

Since the remainder is zero, the process stops.

Since the divisor at this stage is 45,

Therefore, the HCF of 135 and 225 is 45.

(ii)196 and 38220

Since 38220 > 196, we apply the division lemma to 38220 and 196 to obtain

38220 = 196 x 195 + 0

Since the remainder is zero, the process stops.

Since the divisor at this stage is 196,

Therefore, HCF of 196 and 38220 is 196.

(iii)867 and 255

Since 867 > 255, we apply the division lemma to 867 and 255 to obtain

867 = 255 x 3 + 102

Since remainder  $102 \neq 0$ , we apply the division lemma to 255 and 102 to obtain

255 = 102 x 2 + 51

We consider the new divisor 102 and new remainder 51, and apply the division lemma to obtain

102 = 51 x 2 + 0

Since the remainder is zero, the process stops. Since the divisor at this stage is 51, Therefore, HCF of 867 and 255 is 51.

# Q2 :

Show that any positive odd integer is of the form  ${}^{6q+1}$ , or  ${}^{6q+3}$ , or  ${}^{6q+5}$ , where q is some integer.

# Answer :

Let *a* be any positive integer and b = 6. Then, by Euclid's algorithm, a =

6q + r for some integer  $q \tilde{\mathbf{A}} \phi \hat{\mathbf{a}} \in \hat{\mathbf{A}} \hat{\mathbf{A}} \hat{\mathbf{a}} = 0, 1, 2, 3, 4, 5$  because 0 ≤ r

## < 6.

Therefore, a = 6q or 6q + 1 or 6q + 2 or 6q + 3 or 6q + 4 or 6q + 5

Also,  $6q + 1 = 2 \times 3q + 1 = 2k_i + 1$ , where  $k_i$  is a positive integer

 $6q + 3 = (6q + 2) + 1 = 2(3q + 1) + 1 = 2k_2 + 1$ , where  $k_2$  is an integer

 $6q + 5 = (6q + 4) + 1 = 2(3q + 2) + 1 = 2k_3 + 1$ , where  $k_3$  is an integer

Clearly, 6q + 1, 6q + 3, 6q + 5 are of the form 2k + 1, where k is an integer.

Therefore, 6q + 1, 6q + 3, 6q + 5 are not exactly divisible by 2. Hence, these expressions of numbers are odd numbers.

And therefore, any odd integer can be expressed in the form 6q + 1, or 6q + 3, or 6q + 5

Q3 :

An army contingent of 616 members is to march behind an army band of 32 members in a parade. The two groups are to march in the same number of columns. What is the maximum number of columns in which they can march?

### Answer :

HCF (616, 32) will give the maximum number of columns in which they can march.

We can use Euclid's algorithm to find the HCF.

616 = 32 x 19 + 8

32 = 8 x 4 + 0

The HCF (616, 32) is 8.

Therefore, they can march in 8 columns each.

#### Q4 :

Use Euclid's division lemma to show that the square of any positive integer is either of form 3m or 3m + 1 for some integer *m*.

[Hint: Let x be any positive integer then it is of the form 3q, 3q + 1 or 3q + 2. Now square each of these and show that they can be rewritten in the form 3m or 3m + 1.]

## Answer :

Let *a* be any positive integer and b = 3.

Then a = 3q + r for some integer  $q \ge 0$ 

And r = 0, 1, 2 because  $0 \le r < 3$ 

Therefore, a = 3q or 3q + 1 or 3q + 2

Or,

$$a^{2} = (3q)^{2} \text{ or } (3q+1)^{2} \text{ or } (3q+2)^{2}$$
  

$$a^{2} = (9q^{2}) \text{ or } 9q^{2} + 6q + 1 \text{ or } 9q^{2} + 12q + 4$$
  

$$= 3 \times (3q^{2}) \text{ or } 3(3q^{2} + 2q) + 1 \text{ or } 3(3q^{2} + 4q + 1) + 1$$
  

$$= 3k_{1} \text{ or } 3k_{2} + 1 \text{ or } 3k_{3} + 1$$

Where  $k_1$ ,  $k_2$ , and  $k_3$  are some positive integers

Hence, it can be said that the square of any positive integer is either of the form 3m or 3m + 1.

# Q5 :

Use Euclid's division lemma to show that the cube of any positive integer is of the form 9m, 9m + 1 or 9m + 8.

# Answer :

Let *a* be any positive integer and b = 3

a = 3q + r, where  $q \ge 0$  and  $0 \le r < 3$ 

 $\therefore a = 3q \text{ or } 3q + 1 \text{ or } 3q + 2$ 

Therefore, every number can be represented as these three forms. There are three

cases. **Case 1**: When a = 3q,

$$a^3 = (3q)^3 = 27q^3 = 9(3q^3) = 9m$$
,

Where *m* is an integer such that  $a = 3q^3$  **Case 2**: When a = 3q + 1,  $a^3 = (3q + 1)^3 a^3 = 27q^3$   $+ 27q^2 + 9q + 1 a^3 =$   $9(3q^3 + 3q^2 + q) + 1 a^3$  = 9m + 1Where *m* is an integer such that  $m = (3q^3 + 3q^2 + q)$ q **Case 3**: When a = 3q + 2,

 $a^3 = (3q + 2)^3 a^3 = 27q^3$ 

 $+54q^{2}+36q+8a^{3}=$ 

 $9(3q^3 + 6q^2 + 4q) + 8a^3$ 

*=*9*m*+8

Where *m* is an integer such that  $m = (3q^3 + 6q^2 + 4q)$ 

Therefore, the cube of any positive integer is of the form 9m, 9m + 1, or 9m + 8.

#### Next Chapter 2 : Polynomials >>

Exercise 1.2 : Solutions of Questions on Page Number : 11

Q1 :

# Express each number as product of its prime factors:

(i) 140 (ii) 156 (iii) 3825 (iv) 5005 (v)	7429
---	------

# Answer :

- (i)  $140 = 2 \times 2 \times 5 \times 7 = 2^2 \times 5 \times 7$ (ii)  $156 = 2 \times 2 \times 3 \times 13 = 2^2 \times 3 \times 13$
- (iii)  $3825 = 3 \times 3 \times 5 \times 5 \times 17 = 3^2 \times 5^2 \times 17$
- (iv)  $5005 = 5 \times 7 \times 11 \times 13$
- (v)  $7429 = 17 \times 19 \times 23$

# Q2 :

Find the LCM and HCF of the following pairs of integers and verify that LCM × HCF = product of the two numbers.

(i) 26 and 91 (ii) 510 and 92 (iii) 336 and 54

Answer :

(i) 26 and 91  $26 = 2 \times 13$   $91 = 7 \times 13$ HCF = 13 LCM =  $2 \times 7 \times 13 = 182$ Product of the two numbers =  $26 \times 91 = 2366$ HCF × LCM =  $13 \times 182 = 2366$ 

Hence, product of two numbers = HCF × LCM

(ii) 510 and 92  

$$510 = 2 \times 3 \times 5 \times 17$$
  
 $92 = 2 \times 2 \times 23$   
HCF = 2  
LCM =  $2 \times 2 \times 3 \times 5 \times 17 \times 23 = 23460$   
Product of the two numbers =  $510 \times 92 = 46920$   
HCF × LCM =  $2 \times 23460$   
=  $46920$ 

Hence, product of two numbers = HCF × LCM

(iii) 336 and 54  

$$336 = 2 \times 2 \times 2 \times 2 \times 3 \times 7$$
  
 $336 = 2^4 \times 3 \times 7$   
 $54 = 2 \times 3 \times 3 \times 3$   
 $54 = 2 \times 3^3$   
HCF =  $2 \times 3 = 6$   
LCM =  $2^4 \times 3^3 \times 7 = 3024$   
Product of the two numbers =  $336 \times 54 = 18144$   
HCF × LCM =  $6 \times 3024 = 18144$ 

Hence, product of two numbers = HCF × LCM

## Q3 :

Find the LCM and HCF of the following integers by applying the prime factorisation method.

(i) 12, 15 and 21 (ii) 17, 23 and 29 (iii) 8, 9 and 25

Answer :

- (i) 12,15 and 21  $12 = 2^2 \times 3$   $15 = 3 \times 5$   $21 = 3 \times 7$ HCF = 3 LCM =  $2^2 \times 3 \times 5 \times 7 = 420$
- (ii) 17,23 and 29  $17 = 1 \times 17$   $23 = 1 \times 23$   $29 = 1 \times 29$ HCF = 1 LCM =  $17 \times 23 \times 29 = 11339$
- (iii) 8,9 and 25  $8 = 2 \times 2 \times 2$   $9 = 3 \times 3$   $25 = 5 \times 5$ HCF = 1 LCM =  $2 \times 2 \times 2 \times 3 \times 3 \times 5 \times 5 = 1800$

## Q4 :

Given that HCF (306, 657) = 9, find LCM (306, 657).

## Answer :

HCF(306, 657) = 9 We know that, LCM×HCF = Product of two numbers ∴ LCM×HCF = 306×657 LCM =  $\frac{306×657}{HCF} = \frac{306×657}{9}$ LCM = 22338

Q5 :

# Check whether $6^n$ can end with the digit 0 for any natural number *n*.

# Answer :

If any number ends with the digit 0, it should be divisible by 10 or in other words, it will also be divisible by 2 and 5 as

10 = 2 x 5

Prime factorisation of  $6^n = (2 \times 3)^n$ 

It can be observed that 5 is not in the prime factorisation of  $6^{n}$ .

Hence, for any value of n,  $6^n$  will not be divisible by 5.

Therefore,  $6^n$  cannot end with the digit 0 for any natural number n.

# Q6 :

Explain why 7 x 11 x 13 + 13 and 7 x 6 x 5 x 4 x 3 x 2 x 1 + 5 are composite numbers.

# Answer :

Numbers are of two types - prime and composite. Prime numbers can be divided by 1 and only itself, whereas composite numbers have factors other than 1 and itself.

It can be observed that

 $7 \times 11 \times 13 + 13 = 13 \times (7 \times 11 + 1) = 13 \times (77 + 1)$ 

= 13 x 78

= 13 x 13 x 6

The given expression has 6 and 13 as its factors. Therefore, it is a composite number.

 $7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 + 5 = 5 \times (7 \times 6 \times 4 \times 3 \times 2 \times 1 + 1)$ 

= 5 x (1008 + 1)

= 5 x 1009

1009 cannot be factorised further. Therefore, the given expression has 5 and 1009 as its factors. Hence, it is a composite number.

# Q7 :

There is a circular path around a sports field. Sonia takes 18 minutes to drive one round of the field, while Ravi takes 12 minutes for the same. Suppose they both start at the same point and at the same time, and go in the same direction. After how many minutes will they meet again at the starting point?

## Answer :

It can be observed that Ravi takes lesser time than Sonia for completing 1 round of the circular path. As they are going in the same direction, they will meet again at the same time when Ravi will have completed 1 round of that circular path with respect to Sonia. And the total time taken for completing this 1 round of circular path will be the LCM of time taken by Sonia and Ravi for completing 1 round of circular path respectively i.e., LCM of 18 minutes and 12 minutes.

18 = 2 **x** 3 **x** 3

And, 12 = 2 **x** 2 **x** 3

LCM of 12 and 18 = 2 x 2 x 3 x 3 = 36

Therefore, Ravi and Sonia will meet together at the starting pointafter 36 minutes.

Next Chapter 2 : Polynomials >>

Exercise 1.3 : Solutions of Questions on Page Number : 14 Q1 :

Prove that  $\sqrt{5}$  is irrational.

# Answer :

Let  $\sqrt{5}$  is a rational number.

 $\sqrt{5} = \frac{a}{b}$ 

Therefore, we can find two integers  $a, b (b \neq 0)$  such that

Let *a* and *b* have a common factor other than 1. Then we can divide them by the common factor, and assume that *a* and *b*are co-prime.

$$a = \sqrt{5}b$$
$$a^2 = 5b^2$$

Therefore,  $a^2$  is divisible by 5 and it can be said that a is divisible by 5.

Let a = 5k, where k is an integer

 $(5k)^2 = 5b^2$   $b^2 = 5k^2$ This means that  $b^2$  is divisible by 5 and hence, b is divisible by 5. This implies that a and b have 5 as a common factor.

And this is a contradiction to the fact that *a* and *b* are co-prime.

Hence,  $\sqrt{5}$  cannot be expressed as  $\frac{p}{q}$  or it can be said that  $\sqrt{5}$  is irrational.

Q2 :

Prove that  $3+2\sqrt{5}$  is irrational.

### Answer :

Let  ${}^{3+2\sqrt{5}}$  is rational. Therefore, we can find two integrads  $(b \neq 0)$  such that  ${}^{3+2\sqrt{5}} = \frac{a}{b}$   ${}^{2\sqrt{5}} = \frac{a}{b} - 3$   $\sqrt{5} = \frac{1}{2} \left(\frac{a}{b} - 3\right)$ Since *a* and *b* are integers,  ${}^{\frac{1}{2}} \left(\frac{a}{b} - 3\right)$  will also be rational and  $\sqrt{5}$  therefore, is rational.

This contradicts the fact the

is irrational. Hence, our

 $3+2\sqrt{5}$  assumption that is rational is false.

#### Q3:

Prove that the following are irrationals:

(i) 
$$\frac{1}{\sqrt{2}}$$
 (ii)  $7\sqrt{5}$  (iii)  $6+\sqrt{2}$ 

and *b* are integers.

Therefore,  $\sqrt{2}$  is rational which contradicts to the fact that  $\sqrt{2}$  is irrational.

Hence, our assumption is false and  $\sqrt{2}$  is irrational.

(ii) 
$$7\sqrt{5}$$
 is rational.  
Let  $7\sqrt{5}$  Therefore, we can find two integers  $a, b (b \neq 0)$  such that  
 $7\sqrt{5} = \frac{a}{b}$  for some integers  $a$  and  $b$   
 $\therefore \sqrt{5} = \frac{a}{7b}$  is rational as  $a$  and  $b$  are integers.  
 $\frac{a}{7b}$  is rational as  $a$  and  $b$  are integers.  
 $\frac{a}{7b}$  should be rational.  
Therefore,  $\sqrt{5}$  This contradicts the fact that  $\sqrt{5}$  is irrational. Therefore, our assumption that  $7\sqrt{5}$  is  
rational is false. Hence,  $7\sqrt{5}$   
is irrational.  
(iii)  $6 + \sqrt{2}$   
Let  $6 + \sqrt{2}$  be rational.  
Therefore, we can find two integets  $(b \neq 0)$  such that  
 $6 + \sqrt{2} = \frac{a}{b}$   
 $\sqrt{2} = \frac{a}{b} - 6$   
Since  $a$  and  $b$  are integers,  $\frac{a}{b} - 6$  is also rational and hence,  $\sqrt{2}$  should be rational. This contradicts the fact that  $\sqrt{2}$  is irrational. Therefore, our assumption is false and hence,

Exercise 1.4 : Solutions of Questions on Page Number : 17 Q1 :

Without actually performing the long division, state whether the following rational numbers will have a terminating decimal expansion or a non-terminating repeating decimal expansion:

(i) $\frac{13}{3125}$	(ii) $\frac{17}{8}$	(iii) $\frac{64}{455}$	(iv) $\frac{15}{1600}$
(v) $\frac{29}{343}$	(vi) $\frac{23}{2^35^2}$	(vii) $\frac{129}{2^2 5^7 7^5}$	(viii) $\frac{6}{15}$
(ix) $\frac{35}{50}$	(x) $\frac{77}{210}$		

#### Answer :

 $\frac{13}{3125}$ (i)  $\frac{13}{3125}$   $3125 = 5^{5}$ 

The denominator is of the form 5<sup>m</sup>.

Hence, the decimal expansion of  $\frac{13}{3125}$  is terminating.

(ii)  $\frac{17}{8}$ 8 = 2<sup>3</sup>

The denominator is of the form  $2^{m}$ .

17

Hence, the decimal expansion of 8 is terminating.

(iii) 64 455

455 = 5 × 7 × 13

Since the denominator is not in the form  $2^m \times 5^n$ , and it also contains 7 and 13 as its factors, its decimal expansion will be non-terminating repeating.

(iv)  $\frac{15}{1600}$ 

 $1600 = 2^{6} \times 5^{2}$ 

The denominator is of the form  $2^m \times 5^n$ .

Hence, the decimal expansion of  $\frac{15}{1600}$  is terminating.

(v) 
$$\frac{29}{343}$$
  
343 = 7<sup>3</sup>

Since the denominator is not in the form  $2^m \times 5^n$ , and it has 7 as its factor, the decimal expansion of 343 is nonterminating repeating.

(vi) 
$$\frac{23}{2^3 \times 5^2}$$

The denominator is of the form  $2^m \times 5^n$ .

Hence, the decimal expansion of  $\frac{23}{2^3 \times 5^2}$  is terminating.

(vii) 
$$\frac{129}{2^2 \times 5^7 \times 7^5}$$

129

 $2^2 \times 5^7 \times 7^5$ 

Since the denominator is not of the form  $2^m \times 5^n$ , and it also has 7 as its factor, the decimal expansion

 $\frac{6}{15} = \frac{2 \times 3}{3 \times 5} = \frac{2}{5}$ of

is non-terminating repeating.

(viii)

The denominator is of the form 5<sup>*n*</sup>.

Hence, the decimal expansion of 15 is terminating.

$$\frac{35}{50} = \frac{7 \times 5}{10 \times 5} = \frac{7}{10}$$
  
(ix)  $10 = 2 \times 5$ 

The denominator is of the form  $2^m \times 5^n$ .

## Q2 :

Write down the decimal expansions of those rational numbers in Question 1 above which have terminating decimal expansions.
